

ROUGE • INK

BEFORE YOUR EYELINER PROCEDURE

Please be aware . . .

- Immediately following your procedure, the treated area will be brighter and darker in color than the final result.
- Please do not tint your lashes for a minimum of 7 days before your procedure.
- Please do not wear contacts to your procedure, or for 24 hours after your procedure.
- Botox should be done 2 weeks before or 2 weeks after your procedure.
- Avoid exercising the day of your procedure, as this will open up the pores and affect the healing process.
- Do not drink alcohol or caffeine before procedure (at least 24hrs for alcohol).
- Do NOT take Aspirin, Niacin, Vitamin E and/or Ibuprofen for **48-72 hours** prior to your procedure. (Aspirin is a blood-thinner and is not recommended. If you suspect your pain tolerance is low, opt for extra strength Tylenol instead). If you are on blood-thinning medications, please consult with us as well as your doctor.
- If you have had laser removal of previous tattoo work done by another technician, the treated area will now have more scar tissue. More treatments may be necessary to have the skin fully deposit the pigment.
- If you have had any type of eye surgery, consult with your physician in regards to how long you should wait before having a permanent eyeliner procedure.
- We will provide you with Aftercare ointment as well as instructions after your procedure. More information regarding longevity and Aftercare can be found in our FAQ page.

In most cases, 2 appointments are required for desired results. 1 free touch-up appointment is included with your procedure. If you have any further questions, please visit our FAQ page at
